

The figure illustrates the conversion of a Non-deterministic Finite Automaton (NFA) to a Deterministic Finite Automaton (DFA) and its subsequent conversion to a 4-GNFA, 3-GNFA, and RegEx.

**NFA:** The NFA is defined by the following transition table:

| $N$             | $\delta$ | $a$  | $b$ | $\varepsilon$ |
|-----------------|----------|------|-----|---------------|
| $\rightarrow 1$ | 3        | {}   | 2   |               |
| <b>A</b> 2      | 1        | {}   | {}  |               |
| 3               | 2        | 2, 3 |     |               |

**DFA:** The DFA is defined by the following transition table:

| $D$              | $\delta$ | $a$  | $b$ |
|------------------|----------|------|-----|
| 1                | 3        | {}   |     |
| <b>A</b> 2       | 1, 2     | 1, 2 | {}  |
| 3                | 2        | 2, 3 |     |
| <b>A</b> 1, 2    | 1, 3, 2  | {}   |     |
| 1, 3             | 2, 3     | 2, 3 |     |
| <b>A</b> 2, 3    | 1, 2     | 2, 3 |     |
| <b>A</b> 1, 2, 3 | 1, 2, 3  | 2, 3 |     |

**4-GNFA:** The 4-GNFA is defined by the following transition table:

| $4\text{-GNFA}$ | $\delta$ | $a$ | $b$ | $\varepsilon$ |
|-----------------|----------|-----|-----|---------------|
| $s$             | 1        |     |     |               |
| 1               | $s$      |     |     |               |
| $a$             | 2        |     |     |               |
| 2               | $a$      |     |     |               |

**3-GNFA:** The 3-GNFA is defined by the following transition table:

| $3\text{-GNFA}$ | $\delta$ | $a$ | $b$ |
|-----------------|----------|-----|-----|
| $s$             | 1        |     |     |
| 1               | $s$      |     |     |
| $a$             | 1        |     |     |

**RegEx:** The RegEx is defined by the following transition table:

| $\text{RegEx}$ | $\delta$           | $a$ | $b$ |
|----------------|--------------------|-----|-----|
| $s$            | $a^*b(a \cup b)^*$ |     |     |
| $a$            |                    |     |     |

The figure also shows the conversion of the NFA to a RegEx using the following steps:

1. NFA to 4-GNFA: The NFA is converted to a 4-GNFA by adding a start state  $s$  and a final state  $a$ , and removing the original start and final states.

2. 4-GNFA to 3-GNFA: The 4-GNFA is converted to a 3-GNFA by removing the  $\varepsilon$  transitions and adding a new transition labeled  $a \cup b$  from state  $s$  to state  $a$ .

3. 3-GNFA to RegEx: The 3-GNFA is converted to a RegEx by removing the states and transitions, and replacing them with the RegEx  $a^*b(a \cup b)^*$ .

$i \geq 0, xy^i z \in A$ , **(ii)**  $|y| > 0$  and **(iii)**  $|xy| \leq p$ .
